

Automation Failure Rescue

For n8n, Make, Zapier, webhook, API, JSON mapping, retry-loop, and AI automation failures.

What I Diagnose

Broken webhook payloads, missing required CRM fields, failed HTTP/API calls, changed JSON paths, duplicate sends, retry loops, and AI workflow cost spikes.

Package	Best For	Delivery	Price
Starter	One failed step, webhook, API call, or JSON mapping	1 day	\$49
Standard	One workflow/scenario/zap up to 8 steps	2 days	\$199
Premium	Urgent lead, CRM, content, or AI automation failure	1-2 days	\$399

Sample Before / After

Before: CRM fails with missing email because the workflow still maps `email = {{$json["email"]}}` after the payload changed.

After: corrected mapping uses `email = {{$json["lead"]["email"]}}`, then runs one redacted test payload before retries are re-enabled.

Safe Buyer Inputs

Platform name, failed step, exact error text, recent change, expected output, actual output, and redacted screenshots or exported workflow JSON.

Safety Boundary

Do not send passwords, API keys, OAuth tokens, payment data, identity documents, private customer data, or off-platform payment instructions.
