

AI Agent CI Risk Gate

A lightweight pre-merge gate for risky AI agent logs, repeated tool failures, retry loops, and cost spikes.

What It Checks

Repeated tool-call failures, secret-looking strings, timeout clusters, retry loops, high-risk failure density, and configurable score thresholds.

What The Buyer Sends

Redacted repository structure, one redacted sample log or report, CI provider, desired threshold, and paths to ignore. No passwords, tokens, cookies, payout data, ID documents, or private customer data.

Deliverables

Package	Deliverable	Best For
Starter	Workflow draft + threshold advice	Quick warning gate
Standard	Working gate + sample report	Block risky logs before merge
Premium	Tuned gate + handoff notes	Release readiness workflow

Example GitHub Actions Step

```
node cli.js --input ./logs/agent-run.jsonl --fail-on high --format markdown > ai-risk-report.md
```

Public Proof

Safety Boundary

This is a lightweight risk signal, not a full security audit. It does not require access to private production systems.
